2025/11/14

The Evolution of Information Access

Traditional Library Era

1960s

Web Search Era

1990s

Generative AI Era
2020s

Limitations of LLMs

Hallucination & Outdated information

High Training and Inference Cost

Retrieval-Augmented Generation (RAG)

- Provide factual evidence
- Continuously update the index

LLM-Generated Responses vs. RAG

Closed-Book

- Answers questions only using the model's internal knowledge
- Information sources are sealed and unknown
- Smaller inference cost

Open-Book

- Uses external knowledge (retrieval results) to assist LLM generation
- Information sources are **open** and **explicit**
- **Larger inference cost:** retrieval + longer input sequences
- Performance **relies on retrieval quality**

Smarter Retrieval for Smarter Generation

Smarter Retrieval for Smarter Generation

Smarter Retrieval for Smarter Generation

When to Retrieve for RAG?

LLM Knowledge Boundary Perception

Goals

- Effectively determine whether LLMs know/unknow the knowledge
 - Invoke retrieval augmentation **only when the model does not know**, reducing unnecessary RAG overhead
 - Judge the reliability of model outputs

Key Challenges

- LLMs tend to be **overconfident**
- Signals indicating knowledge boundaries are **unclear**

Confidence Estimation

Verbalized Confidence

❑ Mitigating Overconfidence via Prompts

Ask LLMs to Be Prudent

Punish

Add “**You will be punished** if the answer is not right but you say certain”

Challenge

Challenge the correctness of the generated answer

Enhance QA Performance

Explain

Ask the model to **explain the reason** for its answer

Generate

Ask the model to **generate a short document** that aids in answering the question

* These methods can be combined

When Do LLMs Need Retrieval Augmentation? Mitigating LLMs' Overconfidence Helps Retrieval Augmentation. ACL'2024

Verbalized Confidence

Overconfidence Level after Mitigation

Punish+Explain significantly reduces overconfidence by **8.8–55%**.

Effectiveness and Efficiency of Adaptive RAG

Model	Retrieval	NQ					HotpotQA				
		Static	Vanilla	Punish	Explain	Pun.+Exp.	Static	Vanilla	Punish	Explain	Pun.+Exp.
LLaMA2	RA Rate	100%	14.6%	71.4%	9.2%	51.8%	100%	44.8%	78.4%	46.2%	70.2%

Using Punish+Explain, triggering retrieval on **10–50%** of queries will **matching or outperforming** full RAG.

Token-Prob-Based Confidence

❑ How to measure

- Classification: Probability of the generated choice/class
- Free-form Generation: Probability of the generated tokens in the response

$$c = \exp\left(\frac{1}{T} \sum_{t=1}^T \log p_{\theta}^{\pi}(\tilde{r}_t \mid q, \tilde{r}_{<t})\right)$$

❑ Confidence value is continuous; Need binarization to determine when to retireve

- Pre-training will make the classification or multi-choice QA less overconfident; but not for ResNet (probably due to the large amount of parameters)
- Generative models are all overconfident in free-form generation tasks.

[5] Prompting GPT-3 To Be Reliable. Chenglei Si et.al. ICLR 2023

[6] Are Large Language Models More Honest in Their Probabilistic or Verbalized Confidence? Shiyu Ni et.al. CCIR 2024

Token-Prob-Based Confidence

❑ Shifting attention to important tokens^[2]

- Important tokens contribute more to the sentence's semantics
- Assigns token weights as the self-NLI score when token is removed.

❑ Confidence calibration: temperature-scaling^[1] & combined with external features^[3]

Token-prob-based confidence is affected by both the **form** and **semantics** of the response.

However, only semantics matter!

[2] Shifting Attention to Relevance: Towards the Predictive Uncertainty Quantification of Free-Form Large Language Models. ACL 2024

[3] How Knowledge Popularity Influences and Enhances LLM Knowledge Boundary Perception. Arxiv 2025

Self-Consistency-Based Confidence

- ❑ How to measure: Consistency across multiple sampled responses

- Similarity measurement
 - Lexical similarity^[1]: Token overlap
 - Semantic similarity^{[2][3]}: Measured by NLI models or LLMs

[1] *Unsupervised Quality Estimation for Neural Machine Translation*. TACL 2020

[3] *SelfCheckGPT: Zero-Resource Black-Box Hallucination Detection for Generative Large Language Models*. EMNLP 2023

Self-Consistency-Based Confidence

❑ Confidence Consistency-based Calibration ($\mathcal{C}^3$)^[2]

- Converts open-ended questions into multiple-choice questions with variable option counts
- Consistency across different questions

❑ Consistency across outputs of different models^[1]

❑ Consistency across various languages input^[3]

[1] SAC3: Reliable Hallucination Detection in Black-Box Language Models via Semantic-aware Cross-check Consistency. Jiaxin Zhang et.al. *EMNLP 2023*

Internal-State-Based Confidence

- ❑ **Train a confidence estimator** based on internal states
 - a binary classifier
 - verbalized confidence

Training-based methods > zero-shot approaches

- ❑ Estimation before or after answer generation
 - Post-generation [1][2][3]
 - Costly to obtain
 - **Pre-generation [4]**
 - **Only based on questions**

Pre-generation vs. Post generation: 10% cost; 95% alignment performance

Comparisons Across Four Method Types

Confidence Types	Value	Need Training?	Need Ground-Truth Answer?	Performance Rank	Need Access to	Generalization
Verbalized	Discrete	No	No	4	Output Text	Good
Token-Prob-Based	Continuous	No	No	3	Output Logits	Good
Self-Consistency-Based	Discrete	No	No	2	Output Text	Good
Internal-State-Based	Continuous	Yes	Yes	1	Model Parameters	Bad

Pretraining for Confidence Calibration

Can we reduce the amount of ground-truth answers needed to obtain an effective and generalized confidence estimator?

Yes! By incorporating an **unsupervised pre-training** phase.

HonestyBench (560k training, 70k in-domain and out-of-domain evaluation merged from 10 representative QA datasets)

EliCal achieves **~98%** of the upper bound performance using only 1k labeled samples (**~0.18%**)

Better generalization on other types of tasks (e.g., MMLU)

Do LVLMs Know What They Know?

❑ *A Systematic Study of Knowledge Boundary Perception in LVLMs*

- Investigate three types of confidence (token-prob-based/verbalized/self-consistency)
- LVLMs can perceive their knowledge boundaries to some extent
- **Similarities to LLMs:**
 - Overconfident
 - Self-consistency/token-prob-based confidence > verbalized confidence
- **Differences from LLMs:**
 - More honest
 - difficult -> more uncertain
 - Some prompting methods do not work
 - Handling visual modality compromises their instruction-following ability

What episode of the cartoon marked the first time a deaf actor was cast on the show?

Response: The Heartbroke Kid

Answer: The Sound of Bleeding Gums

How to Retrieve for RAG?

Better Retrieval Quality (Relevance)
Better for Generation (Utility)

LLMs as Retriever Backbones

- ❑ Pros: The retriever and generator based on the same backbone could facilitate better leverage of retrieval results by the generator ^[1].
- ❑ Pros: LLM-based retriever have higher potential in retrieving relevant results.
- ❑ Cons: The decoder-only structure makes later tokens invisible from former tokens.

Text Retrieval

Unleashing the Power of LLMs in Dense Retrieval

LLMs are generative methods!!

Query likelihood model:

$$P(d|q) = \frac{P(q|d)P(d)}{P(q)} \propto P(q|d)$$

A generative method to estimate relevance between query and document.

Integrating **query likelihood as an auxiliary training task** for document representation

LLM-QL

Significant performance improvement compared to bidirectional methods and repeating inputs.

Multi-Modal LLMs as Cross-Modal Retrievers

UniME [2]: Distillation from text-embedding LLMs

May not necessarily generalize to other modalities

MoCa [3]: Decoder-only to **bidirectional**

Requires a large amount of data: $\sim 30\text{B}$ tokens

[1] Alec Radford, et al., Learning Transferable Visual Models From Natural Language Supervision. PMLR2021

[2] Haonan Chen, et al., Moca: Modality-aware Continual Pre-training Makes Better Bidirectional Multimodal Embeddings

[3] Gu, T., Yang, K., Feng, Z., Wang, X., Zhang, Y., Long, D., ... & Deng, J. (2025, October). Breaking the modality barrier: Universal embedding learning with multimodal llms. In Proceedings of the 33rd ACM International Conference on Multimedia (pp. 2860-2869).

Pretraining Multi-Modal LLMs for Retrieval

CoMA

- Annotating diverse QA pairs covering different content of the images with MLLMs

With a small amount of pre-training data (0.3B tokens), CoMa can achieve better performance than MoCa (30B tokens.)

From Relevance to Utility - Utility-Focused Result Selection for RAG

Relevance
aboutness

VS

Utility
value

Effectiveness Measures

Two sets of measures for evaluating the effectiveness of a search have been used, based on the two most often used criteria:

1. *Relevance*: the degree of fit between the question and the retrieved item. The criteria of "*aboutness*" is used.
2. *Utility*: the degree of actual usefulness of answers to an information seeker. The criteria used is the *value* to the information seeker.

Saracevic, Tefko, et al. "A study of information seeking and retrieving. I. Background and methodology." *Journal of the American Society for Information science* 39.3 (1988): 161-176.

Utility in RAG: emphasizes the **usefulness** of a passage in facilitating the generation of an **accurate and comprehensive answer** to the question.

Zhang, Hengran, et al. "Are Large Language Models Good at Utility Judgments?." Proceedings of the 47th International ACM SIGIR Conference on Research and Development in Information Retrieval. 2024 (SIGIR'24). pp. 1941-1951

Using utility as criterion for selection yields **superior generation performance** over relevance

Utility-Focused Result Selection for RAG

LLM-Centric Utility-Based Result Selection for RAG

Utility Judgments

w.r.t. answer

- **Judged by LLMs verbalized with pseudo answers** ^{[1][2]}
- Likelihood ^{[3][5]} of generating ground-truth answers
- Attention ^[4] to input documents

Costly; cannot scale to larger candidate sets

Relevance in Philosophy

ITEM: Iterative utility judgment framework ^[2]

[1] Zhang, H., Zhang, R., Guo, J., de Rijke, M., Fan, Y., & Cheng, X. (2024, July). Are Large Language Models Good at Utility Judgments?. In Proceedings of the 47th International ACM SIGIR Conference on Research and Development in Information Retrieval (pp. 1941-1951).

Training a Utility-Focused Retriever with LLM Judgments

Utility-focused annotation is much better than relevance-focused annotation.

Utility-focused annotation has better generalization performance in retrieval and RAG

Distilling a Small Utility-Focused Selector for RAG

Scale utility-focused selection to a large number of candidate passages (from ~20 to 100+)

From General Utility to LLM-specific Utility

Gold utilitarian passage for specific LLM:

The inclusion of this passage leads to a performance gain in RAG performance.

➤ RAG Performance Ranking:

- 1st (Best): Gold utilitarian passages from the LLM itself
- 2nd: Human-annotated positive passages
- 3rd (Worst): Passages from other LLMs, especially other series

From General Utility to LLM-specific Utility

Among human-annotated positives:
LLM-specific ground-truth vs. others

- LLM cannot understand or take sufficient use of a passage that humans consider useful.
- PPL of gold passages < others

QA performance based on LLM-specific
utility-based selection

- The utilitarian passages selected by existing methods do not appear to be sufficiently LLM-specific.
- We need to explore better methods for enhancing LLM-specific utility judgment performance!

Summary

- ❑ When should LLMs invoke retrieval augmentation?
 - When the model does not possess the internal knowledge
 - Enhance the model's awareness of its knowledge boundaries
 - Prompt the model to be more cautious
 - Consistency-based methods
 - Pretraining-based method (EliCal on HonestyBench)
- ❑ How to provide more beneficial results for LLM generation?
 - LLM-based retrievers
 - Modeling query-likelihood (text)
 - image QA data augmentation (multi-modal)
 - Utility-based result retrieval/selection
 - Iterative utility judgment framework
 - Utility-oriented retrievers/selectors for RAG
 - From General utility to LLM-specific Utility
